

VA Master **FAM540**

Metal Cone Variable
Area Flowmeter

Engineering Flow and Temperature Excellence

For measuring liquids, gases and steam

Graphical 2-line LCD display

Magnet stick operation

- Configuration also possible with closed housing

Easily adjustable for new operating conditions

Approvals for explosion protection

- ATEX
- IECEx
- FM, CSA

Overview

Model	FAM541	FAM544
	Standard design	Hygienic design
		
Measured error in accordance with VDE / VDI 3513	1.6 % qg = 50 %	1.6 % qg = 50 %
Reproducibility	0.25 % of measured value	0.25 % of measured value
Process connection	Flange in accordance with DIN, ASME, JIS, female thread	Thread DIN 11851, SMS 1145
Nominal connection diameters	DN 15 (½ in) to DN 80 (3 in)	DN 25 (1 in) to DN 80 (3 in)
Maximum measuring medium temperature	400 °C (752 °F)	140 °C (284 °F)
Maximum pressure rating	PN 400 / class 2500	PN 40
Wetted material	Stainless Steel 316/316L (1.4401/1.4404), 316Ti (1.4571)	Stainless Steel 316/316L (1.4401/1.4404), 316Ti (1.4571)
Housing material	Aluminum and Stainless Steel (1.4408)	Aluminum and Stainless Steel (1.4408)
Gasket material	Viton A (DN 15 only)	Viton A (DN 25 only)
Indicator / transmitter		
IP degree of protection in accordance with EN 60529	IP 66, IP 67, NEMA 4X	
Mechanical indicator	Analog indicator with or without alarm signaling unit	
Electronic indicator	Analog indicator with transmitter 4 to 20 mA, with or without LCD indicator	
Communication	HART® protocol (only for analog indicators with transmitters)	
Power supply	Without alarm signalling unit: no power supply Analog indicator with alarm signaling unit: 8 V DC via switch amplifier Analog indicator with transmitter: 10 to 46 V DC (Ex: 10 to 30 V DC)	
Indicator housing material	Al Si 12 material number 3.2582 (copper content 0.1 %), stainless steel 1.4408	
Paint	Epoxy paint 80 to 100 µm; bottom color: RAL 7012, cover color: RAL 9002 (No housing paint for stainless steel indicator housing)	
Approvals		
Ex approvals	ATEX / IECEx: Zone 0 / 1 / 2 / 21 FM / cCSAus: XP, IS, DIP, NI, FM Zone 1 + 2	
Sealing concept	Dual sealing in accordance with ANSI / ISA-12.27.01	
SIL approval	Contact McMenon for further details	

Introduction and basics

Installation conditions

- The installation recommendations of VDI / VDE Directive 3513 must be observed.
 - The flowmeter is installed vertically in the piping. The measuring media must flow from bottom to top.
 - Keep the device as far away as possible from pipe vibrations and powerful magnetic fields.
 - The nominal diameter of the piping should be the same as the connection nominal diameter.
 - Inlet and outlet sections are generally not required. Care should be taken to avoid flow turbulence, pulsations, pressure shocks and other flow instabilities in order to prevent measuring inaccuracies, increased wear or damage.
 - When selecting devices, pay close attention to the chemical resistance of the wetted parts of the device and the process connection gaskets in relation to the measuring medium.
 - Avoid pulsating flow of the measuring medium. Use the optional float damping if necessary.
 - For gaseous measuring media we recommend an undisturbed inlet length of five times the inside diameter of the piping in accordance with VDI / VDE Directive 3513 sheet 3. Additional measures such as flow straighteners or perforated plates may be necessary for highly unbalanced flow profiles.
 - Avoid contamination of gaseous measuring media (refer to BGR 132-7.3.2.2.2).
 - For liquid measuring media, the nominal diameter of the piping should be dimensioned as large as possible (if economically viable).
 - Avoid gas inclusions in liquid measuring media.
 - Use valves which open slowly.
 - If the flowmeter is installed in a pipeline where decommissioning is impossible or inexpedient, a bypass line should be provided.
- Stop and throttle valves should preferably be attached to the outlet of the flowmeter.

Introduction and basics

Figure 1: Installation of the flowmeter (example)

Refer to VDI/VDE Directive 3513 sheet 3, Selection and Installation Recommendations for Variable Area Flowmeters.

Sensor insulation

Figure 2: Insulation of the flowmeter

As shown in Figure 2, the flowmeter may only be insulated up to the flange diameter.

Operating conditions

A variable area flowmeter is specified for a defined set of operating conditions of the measuring medium. For liquids and gases, these are pressure and temperature-related properties (density and viscosity) under operating conditions.

For gases, in particular, this means operating at a specific operating pressure and operating temperature. The specified accuracy of the device always refers to the operating conditions underlying the specification.

Temperature data

The following diagram shows the maximum permissible measuring medium temperature depending on the ambient temperature.

Figure 3: Medium temperature (T_{medium}), ambient temperature (T_{amb})

Note

When using in potentially explosive atmospheres, observe the temperature information in the ATEX / IECEx limit values starting from **Safety specifications ATEX / IECEx** on page 24 and the FM / cCSAus limit values tables starting from **Safety specifications FM, cCSAus** on page 33!

Pressure loss

The available operating pressure at the measuring point must be higher than the pressure loss listed for the flowmeter in the specifications.

It is important to also consider the pressure loss downstream from the flowmeter due to losses in the piping and other fittings.

Prevention of compression oscillations when measuring gases

During low flow amounts and low operating pressure, so-called compression oscillations of the float can occur.

If the maximum upstream pressure listed in the specifications is not reached, the flowmeter can optionally be equipped with a gas damper.

To prevent self-generated compression oscillations, note the following information from VDI / VDE 3513 Sheet 3:

- Select a flowmeter with the lowest possible pressure loss.
- Minimize the piping length between the flowmeter and the nearest upstream or downstream throttling location.
- Set the limit of the regular measuring range from the usual 10 to 100 % to 25 to 100 %.
- When setting the flow rate value, always start by assuming larger values.
- Increase the operating pressure and consider its effect on the flow rate changes due to the change in gas density in the operating conditions.
- Minimize non-throttled, free volumes upstream and downstream of the device.

Pressure shocks

Especially when measuring gases, it is possible that pressure or shock waves can occur when fast opening solenoid valves are employed and the piping cross-sections are not throttled, or if there are gas bubbles in liquids.

As a result of the sudden expansion of the gas in the piping, the float is forcibly driven against the upper floatstop.

Under certain conditions, this can lead to destruction of the device.

Gas damping is not suited to compensating for pressure shocks!

Solids content in the measuring medium

Variable area flowmeters have only limited suitability for measuring media containing solids.

Depending on the concentration, particle size and type of solid, increased mechanical abrasion may occur, especially at the critical measuring edge of the float.

In addition, solidified deposits on the float can change its weight and shape.

These effects can lead to erroneous measurement results, depending on the float type.

In general, the use of appropriate filters is recommended in such applications.

For the flow measurement of measuring media containing magnetic particles, we recommend the installation of a magnetic separator upstream of the variable area flowmeter.

Float designs

Figure 4: Float designs

Float 'S':

Basic shape of float.

Low flow rates, minimal pressure losses, essentially independent of viscosity; lower upstream pressure required for gas measurement.

Float 'N':

Higher flow ranges, average pressure losses, well suited to liquids with minimum viscosity; higher minimum upstream

pressure requirements for gas measurements.

Float 'X':

Highest flow rates, maximum pressure losses, well suited to liquids with minimum viscosity; higher minimum upstream pressure requirements for gas measurements.

Measuring range limits

Figure 5: Flow rate depending on float shape and weight (example)

For measuring range limits depending on nominal size and float type, refer to the measuring range tables.

Calculating the viscosity influence number (VIN)

The floats are designed geometrically so as to be independent of viscosity within broad limits. This means that the measuring medium viscosity can vary within these limits without resulting in a change of scale.

The viscosity influence number (VIN) is given in the device measuring range tables.

- If the calculated VIN is greater than the listed VIN, viscosity has no influence on the measured values.
- If the calculated VIN is greater than the listed viscosity, the flowmeters are equipped from the factory with a scale adjusted to the viscosity of the measuring medium.

$$VUZ = \eta \cdot \sqrt{\frac{(\rho_{s1} - \rho_1) \cdot 1}{(\rho_{s1} - \rho_1) \cdot \rho_1}}$$

Legend

η	Dynamic viscosity of the measuring medium [mPa s]
ρ_s	Density of the float in accordance with the selection in the measuring range table ($\rho = 8.02 \text{ g/cm}^3$)
ρ_{s1}	Density of the float being used
ρ_1	Density of the measuring medium

Indicator and transmitter

A magnet in the float translates the height of the float as a measurement for the flow to the decouple-proof magnet follower system of the flowmeter, which is directly connected to the indicator pin.

For analog indicators, the flow value is shown by the indicator on the scale. For indicators with a two-wire transmitter, the indicator position is additionally measured directly at the axis.

A standard eddy-current brake is used to dampen indicator vibrations and ensure outstanding readability.

The indicator/transmitter unit is attached to the flowmeter with 2 screws in a reproducible manner. To facilitate installation, the indicator can be removed. A name plate on the flowmeter bracket allows you to assign a unique identifier at a later date.

Analog indicator with or without alarm signaling unit

The analog indicators are available with or without an alarm signaling unit. The alarm signaling units are housed on an alarm module that can also be retrofitted. It is available as a single (min. or max. alarm) or dual (min. or max. alarm) alarm module.

Figure 6: Analog indicator

Pressure loss

- Decouple-proof and hysteresis-free magnet follower system.
- The device conforms to NAMUR Recommendations NE43, NE53, NE107.
- The installation and disassembly of the analog indicator on the meter tube is possible without opening the indicator housing.
- Reading repeatability: ± 0.25 % of scale end value.
- The alarm signaling unit can be retrofitted as an alarm module.

- The switching points of the alarm signaling units can be adjusted without removing the scale.
- The set switching points of the alarm signaling units are visible from the exterior.

Alarm signaling unit

A switching amplifier is needed to operate the alarm signaling units.

See Main ordering information FAM541 on page 39 for further information.

Alarm signaling unit specifications

Operating mode	bistable
Reproducibility	± 0.5 % of scale end value
Nominal voltage	8 V DC (Ri approx. 1 k Ω)
Operating voltage	5 to 25 V DC
Switching frequency, max.	3 kHz

Switching amplifier

For analog indicators with alarm signaling units (model FAM54xB/C/Dx)

Specifications

Power supply	230 V AC, +10 % / -15 %, 45 to 60 Hz 115 V AC, +10 % / -15 %, 45 to 60 Hz 24 V DC, +10 % / -15 %
Output	One or two switching relays with potential free changeover contacts
Switching capacity	Maximum 250 V, maximum 4 A, maximum 500 VA
Maximum permissible cable length	Between the switching amplifier and alarm signalling unit: 300 m (984 ft)
Permissible ambient temperature range	-20 to 60 °C (-4 to 140 °F)
Electrical connection	Screw terminals, maximum 2.5 mm ² (14 AWG)
Type of assembly	35 mm top-hat rail in accordance with EN 60715:2001
IP rating	IP 20 in accordance with EN 60529
Weight	approx. 150 g (0.3 lb)

Analog indicator with transmitter

The electronic transmitter uses two-wire technology. An optional LCD indicator offers the possibility of adjusting on-site to changed measuring medium parameters.

For models with an LCD indicator, McMenon recommends that you use a bar graph scale to avoid differences between a product scale and the flow rate shown on the LCD indicator.

Figure 7: LCD indicator with operating buttons and magnet stick markings

Product highlights

- 4 to 20 mA current output.
- In the event of an alarm, current output can be adjusted to 21 to 23 mA (NAMUR NE43).
- Programmable binary output (min. / max. device alarm, general alarm or pulse output).
- Parameterization using HART communication via handheld terminal or DSV401 (SMART VISION).
- Damping: can be adjusted 1 to 100 s (5τ).
- Low flow cut-off: 0 to 5 % for current and pulse output.
- Measuring medium parameters can be changed at any time (pressure and temperature influence, density, units, etc.).
- Simulation of current and binary output (manual process execution).
- EEPROM storage of counter readings and parameters specific to the measuring point (over 10 years).
- LCD indicator can be retrofitted.

LCD Indicator

- High-contrast LCD indicator.
- Flow rate and flow totalizer value display.
- Plain text fault diagnostics
- Menu-guided parameterization with four buttons.
- Parameterization of the device using a magnet stick without opening the housing.

Electrical connections

Note

When using in potentially explosive atmospheres, observe the electrical data in the ATEX / IECEx limit value tables starting from Safety specifications ATEX / IECEx on page 24 and the FM / cCSAus limit value tables starting from Safety specifications FM, cCSAus on page 33!

... Electrical connections

Cable

Maximum cable length 1500 m, AWG 24 twisted and shielded.

Power supply / current output

Terminals 31 / 32 serve both as a connection for the power supply and as a 4 to 20 mA current output for the transmitter. The current output is also used for HART® communication.

Power supply	
Terminals	31 / 32
Voltage	Standard: 10 to 46 V DC Explosion-proof design: 10 to 30 V DC
Residual ripple	maximum 5 % or. $\pm 1.5 V_{ss}$
Power consumption	< 1 W

Current output	
Terminals	31 / 32
Output	4 to 20 mA, can be configured to 21 to 23 mA for an alarm (in accordance with NAMUR NE43)
Load	Minimum > 250 Ω , maximum 1500 Ω (for I at alarm = 23.0 mA)
At zero-point	$\leq 8 \mu A/K$
Power consumption	< 1 W

Figure 10: Current output load diagram

HART output

Model FAM54xE/Fx

Specifications	
Terminals	31 / 32
Configuration	• Directly on the device • Using DAT200 Asset Vision Basic software and HART-DTM
Transmission	FSK modulation on current output 4 to 20 mA in accordance with the Bell 202 standard
Baud rate	1200 baud
Display	Logic 1: 1200 Hz Logic 0: 2200 Hz
Maximum signal amplitude	1.2 mAss
Load (RB) at current output	250 to 1500 Ω

See the separate interface description for detailed information.

System integration

In conjunction with the DTM (Device Type Manager) available for the device, the corresponding framework applications in accordance with FDT 0.98 or 1.2 (DAT200 Asset Vision Basic) can be used for communication (configuration, parameterization).

Other tool or system integrations (e.g. Emerson AMS / Siemens PCS7) upon request.

The necessary DTMs and other files can be downloaded from www.mcmenon.com/flow.

Programmable binary output

Terminals 41 / 42 are used as a primary programmable binary output. The pulse output, general alarm, min./max. alarm and general alarm functions, as well as "no function" can be configured using the software.

Binary output	
Terminals	41 / 42
Output	• NAMUR contact (DIN 19234) or • Standard optoelectronic coupler (UH = 16 to 30 V DC)
Switching behavior	As normally closed or normally open contacts
Internal resistance	With contact open > 10 k Ω
Switching current	Maximum 15 mA
Output Voltage	Minimum U_s 2 V DC

Pulse output	
Terminals	41 / 42
Pulse width	5 to 256 ms, maximum 50 % of the period
Frequency fmax	Maximum 50 Hz

Model FAM541 - Standard design

Figure 11: Model FAM541

Scale

Design optionally with percentage scale or product scale.

Gas damping

Option, for preventing compression oscillations in case of gas measurements with low operating pressure.

SIL approval

Contact McMenon for further details

Measuring accuracy

1.6 % qg = 50 % in accordance with VDE / VDI 3513, sheet 2, optional
1 % of upper range value.

Measuring range limits and span limits

Measuring span: 10:1

For detailed information about measuring ranges, see

[Measuring range table](#) on page 12.

Temperature limits °C (°F)

Medium temperature range

-55 to 400 °C (-67 to 752 °F)

Ambient temperature range

-40 to 85 °C (-40 to 185 °F)

Note

- For use in potentially explosive atmospheres, observe the temperature information in the ATEX / IECEx limit values starting from Safety specifications ATEX / IECEx on page 24 and the FM / cCSAus limit values tables starting from Safety specifications FM, cCSAus on page 33!
- Additionally for specifications refer to Temperature Data on page 4!

Process connections

- Flange in accordance with EN 1092-1 (PN 16, PN 40)
- Flange in accordance with DIN 2501 (PN 63, PN 100)
- Flange with groove in accordance with DIN 2501
- Flange in accordance with ASME B16.5
- Female thread G 1 in (½ in meter tube)
- Female thread G 1 ½ in (1 in meter tube)
- Female Thread NPT 1 in (1/2 in meter tube)
- Female Thread NPT 1 1/2 in (1 in meter tube)

Pressure ratings

- Standard pressure rating PN 40
- Flange in accordance with DIN / EN: PN 16, PN 40, PN 63, PN 100
- Flange in accordance with ASME: CL 150, CL 300, CL 600

Other designs and pressure ratings are available upon request.

See also Material load on page 11.

Maximum permissible operating pressure

64 bar, 100 bar, 160 bar, 250 bar

(CL 600 / CL 900 / CL 1500 / CL 2500)

1. Connection nominal diameter
2. The upper range value can be selected anywhere within these limits. The measuring span is 10:1.
Example: upper range value 12 m³/h (USgal/h) water, measuring span of the device 1.2 to 12 m³/h (USgal/h) water.
3. Order code for meter tube / float construction (versions 18, 19), see Main ordering information FAM541 on page 39.
4. Viscosity influence number (VIN), see Calculating the viscosity influence number (VIN) on page 5.
5. The listed pressure loss values are based on the respective upper range value.
6. The minimum required static pressure (abs) to prevent compression oscillations (float bounce) in the meter tube. The specifications for the minimum required pressures with and without damping are based on average installation conditions. Some installations may have higher values (high free volume upstream / downstream of the device).
7. These meter tube / float combinations always require gas piston damping for gas measurements.

Dimensions

- ① Threaded bushing ½ in NPT
- ② Cable entry M20 × 1.5
- ③ Plug M25 × 1.5 (model FAM541-A only)
- ④ N number of holes
- ⑤ Ground terminal
- ⑥ LCD display only for FAM541-F

Model FAM544 - Hygienic design

Figure 15: Model FAM544 in hygienic design

This model has been specially constructed with threaded connections in accordance with DIN 11851 to meet the more stringent hygienic requirements of the food and beverage industry in respect of biological cleaning.

All parts of the flowmeter that come into contact with the measuring medium are welded and polished. There are no gaps or other empty areas. The device is suitable for cleaning or sterilization with steam, acids and alkali. The device is also CIP-cleanable.

Scale

Design optionally with percentage scale or product scale.

Gas damping

Not available.

SIL approval

Contact McMEnon for further details

Model FAM544 - Hygienic design

1.6 % qg = 50 % in accordance with VDE / VDI 3513, sheet 2, optional 1 % of upper range value.

Measuring range limits and span limits

Measuring span: 10:1

For detailed information about measuring ranges, see

Measuring range table on page 18.

Temperature limits °C (°F)

Medium temperature range

-55 to 400 °C (-67 to 752 °F)

Ambient temperature range

-40 to 85 °C (-40 to 185 °F)

Note

- For use in potentially explosive atmospheres, observe the temperature information in the ATEX / IECEx limit values starting from Safety specifications ATEX / IECEx on page 24 and the FM / cCSAus limit values tables starting from Safety specifications FM, cCSAus on page 33!
- Additionally for specifications refer to Temperature Data on page 4!

Process connections

- Threaded spud in accordance with DIN 11851 (SC 25 to SC 80)
- Threaded spud in accordance with SMS 1145 (DN 38 to DN 76)

Connection dimensions

SMS 1145

DIN 11851

Nominal diameter	Measuring tube sizes		—
			DN 38
DN 25	½ in	SC 25	DN 51
DN 40	1 in	SC 40	DN 76
DN 50	2 in	SC 50	
DN 80	3 in	SC 80	

Pressure ratings

Threaded spuds in accordance with DIN 11851:

- PN 25 for DN 50 to DN 80 (2 to 3 in)
- PN 40 for DN 25 to DN 40 (1 to 1 ½ in)

Threaded spud in accordance with DIN 1145:

- PN 6 for (DN 38 to DN 76)

Maximum permissible operating pressure

Refer to **Material load** on page 17.

1. Connection nominal diameter
2. The upper range value can be selected anywhere within these limits. The measuring span is 10:1.
Example: upper range value 12 m³/h (USgal/h) water, measuring span of the device 1.2 to 12 m³/h (USgal/h) water.
3. Order code for meter tube / float construction (versions 18, 19), see Main ordering information FAM544 on page 44.
4. Viscosity influence number (VIN), see Calculating the viscosity influence number (VIN) on page 5.
5. The listed pressure loss values are based on the respective flow rate end value.
6. The minimum required static pressure (abs) to prevent compression oscillations (float bounce) in the meter tube. The specifications for the minimum required pressures are based on average installation conditions. Some installations may have higher values (high free volume upstream / downstream of the device).
7. Only for threaded spuds in accordance with DIN 11851

Use in potentially explosive atmospheres in accordance with ATEX and IECEx

Device overview

The devices are designed for maximum versatility. This is achieved through a combination of several types of protection within each device. All devices are suitable for use in potentially explosive atmospheres with combustible dust. For detailed installation instructions and terminal assignments, refer to Electrical connections on page 8.

* Order code 'Explosion protection and approvals' (versions 9, 10); refer to Ordering Information on page 39.

...Use in potentially explosive atmospheres in accordance with ATEX and IECEx

Ex Marking

Note

- Depending on the design, a specific marking in accordance with ATEX or IECEx applies.

Electrical connections

Figure 17: ATEX / IECEx electrical connection

Figure 18: Terminals 31 / 32, power supply / load

UV Power supply

RB Maximum permissible load in the power supply (z. B. indicator)

The minimum voltage UV = 0 V is based on a load of 0 Ω.

Terminal	Function
31 / 32	Power supply / current output / HART output
41 / 42	Programmable binary output
	Alarm signaling unit (min.)
51 / 52	Alarm signaling unit (max.)

Signal cable

The Ex calculations are based on temperatures of 80 °C (176 °F) at the cable input. For this reason, cables with a specification of 80 °C (176 °F) must be used.

For cables limited to 70 °C (158 °F), a maximum ambient temperature of $T_{amb} = 60\text{ °C}$ (140 °F) applies.

The resulting new maximum measuring medium temperatures are determined as follows:

- Calculate a new ambient temperature: $T_{amb\ new} = T_{amb} + 10\text{ °C}$ (18 °F).
- Use the calculated ambient temperature $T_{amb\ new}$ to determine the new associated permissible measuring medium temperatures in the tables.
- Please use the limit value tables with the original ambient temperature T_{amb} to determine the relevant temperature class. See Safety specifications.

ATEX / IECEx on page 24, Tables 1 to 5.

Example:

- $T_{amb} = 50\text{ °C}$ (122 °F) becomes $T_{amb\ new} = 60\text{ °C}$ (140°F).
- Determine the measuring medium temperature $T_{amb} = 60\text{ °C}$ (140 °F).
- Determine the temperature class for $T_{amb} = 50\text{ °C}$ (122°F).

Figure 19: Grounding

The FAM540 housing must be correctly earthed in order to ensure proper function and safe operation.

Copper wires with a minimum cross-section of 6 mm² (AWG 10) must be used to connect to the potential equalization.

Note

The operator must make sure that when connecting the protective ground (PE), there are no potential differences between protective ground (PE) and potential equalization, even in the event of a fault.

Use in potentially explosive atmospheres in accordance with FM and CSA

Device overview

The devices are designed for maximum versatility. This is achieved through a combination of several types of protection within each device. All devices are suitable for use in potentially explosive atmospheres with combustible dust. For detailed installation instructions and terminal assignments, refer to Electrical connections on page 8.

Class 1 Division 1 / Zone 1

Class 1 Division 2 / Zone 2

 Potential equalization

* Order code 'Explosion protection and approvals' (versions 9, 10); refer to **Ordering Information** on page 39.

...Use in potentially explosive atmospheres in accordance with ATEX and IECEx

Ex Marking

Note

- Depending on the design, a specific marking in accordance with FM applies.

4. For connection to a non-intrinsically safe circuit.

Electrical connections

Figure 20: FM / cCSAus electrical connection

Terminal	Function
31 / 32	Power supply / current output / HART output
41 / 42	Binary output
	Alarm signaling unit (min.)
51 / 52	Alarm signaling unit (max.)

Figure 21: Terminals 31 / 32, power supply / load

UV Power supply

RB Maximum permissible load in the power supply (z. B. indicator)

The minimum voltage $U_V = 0 \text{ V}$ is based on a load of 0Ω .

Installation instructions

The concept of intrinsic safety enables multiple intrinsic safety devices with FM or CSA approval to be interconnected, without entity parameters being examined specifically, subject to observation of the following conditions:

- U_o or V_{oc} or $V_t \leq 0 \text{ V max}$, I_o or I_{sc} or $I_t \leq I \text{ max}$, C_a or $C_o \geq C_i + C_{cable}$, L_a or $L_o \geq L_i + L_{cable}$, $P_o \leq P_i$.
- For installation in Class II and III environments, dust- proof ignition blocks must be used.
- Devices connected to such equipment must not use or generate rms or DC voltage in excess of 250 V.
- The installation must meet the requirements in accordance with ANSI / ISA RP 12.6 'Installation of Intrinsically Safe Systems for Hazardous Locations' and the National Electrical Code (ANSI / NFPA 70) sections 504, 505 and CEC.
- The configuration of the associated apparatus must have Factory Mutual Research and CSA approval in accordance with the entity concept.
- Devices must be installed in accordance with the manufacturer-supplied installation drawing of the associated equipment.
- Changes to drawings are only permitted subject to prior approval from Factory Mutual Research and CSA.
- Only shielded twisted pair cables may be used (see above).

Note

For intrinsically safe installations, the FAM540 must be installed as illustrated in the "Intrinsic Safety Control Drawing SDM-10-A0253".

... Use in potentially explosive atmospheres in accordance with FM and cCSAus

Earthing

Figure 21: Terminals 31 / 32, power supply / load

The FAM540 housing must be correctly earthed in order to ensure proper function and safe operation.

Copper wires with a minimum cross-section of 6 mm² (AWG 10) must be used to connect to the potential equalization.

Note

The operator must make sure that when connecting the protective ground (PE), there are no potential differences between protective ground (PE) and potential equalization, even in the event of a fault.

Signal cable

For ambient temperatures below 5 °C (41 °F) or above 40 °C (104 °F), signal cables that are suited for the minimum/maximum ambient temperatures in question must be used.

Only use signal cables made from copper, copper-coated aluminum, or aluminum.

The recommended tightening torque for the terminals is 0.8 Nm (7 in lb) or higher, in accordance with the specification.

Power supply

Installation must comply with the requirements of the National Electric Code® (ANSI / NFPA70).

Unless specified otherwise in regional or national standards, power supply lines must be dimensioned to AWG 20.

Installation must be carried out as outlined in the latest edition of the manufacturer's instruction manual.

A power supply with the following requirements must be used to provide power:

- SELV (safety extra-low voltage) with LPS (current- limited source) and double or reinforced insulation.
- Maximum output current of 8 A (current-limited output).
- In accordance with National Electric Code® (ANSI / NFPA70) connected to NEC class 2.

Ordering Information

Main ordering information FAM541

FAM541 Metal Cone Variable Area Flowmeter, standard, for general purposes	X	X	XX	XX	X	X	XX	X	XX
Display Type / Output Signal									
Analog indicator / Without	A								
Analog indicator / Min-Alarm (Amplifier D163A011U01 to U03 as a separate item)	B								
Analog indicator / Max-Alarm (Amplifier D163A011U01 to U03 as a separate item)	C								
Analog indicator / Min- and Max-Alarm (Amplifier D163A011U04 to U06 as a separate item)	D								
Analog indicator / 4 to 20 mA with HART protocol	E								
Analog indicator with LCD display / 4 to 20 mA with HART protocol	F								
Housing Material / Cable Gland									
Aluminium / Cable gland M20 × 1.5 (Indicator type A with blind plug M25 × 1.5)		1							
Aluminium / Thread ½ in NPT (Indicator type A with blind plug M25 × 1.5)		2							
Stainless steel / Cable gland M20 × 1.5 (Indicator type A with blind plug M25 × 1.5)		3 ¹
